

Supplementary Figure 12: Detection of traps in urine samples of tumour bearing mice. Urine was collected 20 and 24 days after transgene induction from A-673 (**A**) and HT-29 (**B**) tumour bearing mice. Arrows indicate intact traps, while asterisks degraded forms. Two microliters of urine was used from each sample for western blot analysis, and traps were detected using anti-human IgG1-HRP antibody. Recombinant hIgG was used as control.
