

Supplementary Figure 15: Immunostaining of mouse eye cross sections for VEGF-trap. Dissections were performed 2 hrs post intravitreal injection of VEGF-trap (10 μ g). Minute amounts of trap were detected in the choroid (**A**), while it was not detectable in other areas of the eye such as the inner limiting membrane, ciliary body (**B**); iris, and lens (**C**). *ir*; iris, *cb*; ciliary body, *l*; lens, *ilm*; inner limiting membrane; *inl*; inner nuclear membrane; *onl*; outer nuclear membrane, *gl*; ganglion cell layer, *rpe*; retinal pigmented epithelium cell layer, *ch*; choroid. Scale bars, 100 μ m.
