

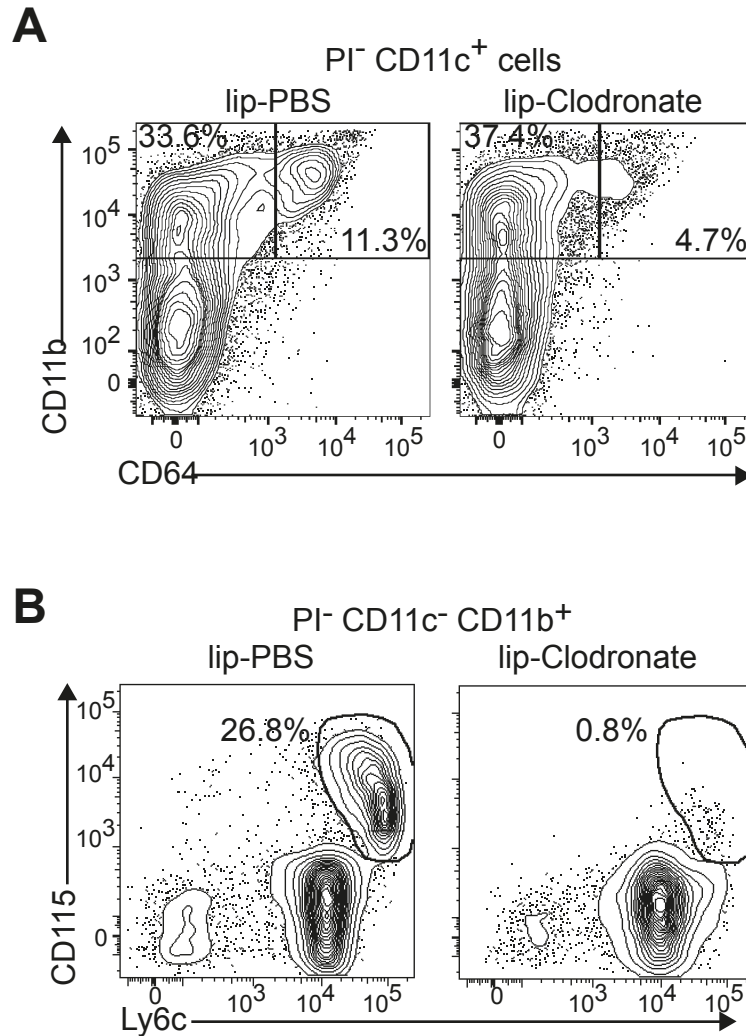

Figure S6: Impact of clodronate treatment

C57Bl6 animals were immunised with Ag in IFA with CpG and treated with liposomes containing either PBS or clodronate.

2 days after immunisation, the expression of CD11b and CD64 at the surface of CD11c⁺ cells in the draining LN was estimated (**A**) or 9 days after immunisation, monocyte depletion was assessed in the blood of animals (**B**) (n≥4/group, mean ± SEM).
