

Online Supplemental Figure 7. Association of Tbx3 binding peaks (ChIP-seq) in the vicinity of genes known to be expressed in the myocardium and up- or downregulated by ectopic Tbx3 expression in the atria (*Acta2*, *Hcn4*, *Gja7*, *Cacna2d2*, *Bmp4*). Genes typically expressed in cushion mesenchyme (eg. *Sox9*), or induced in endocardium by myocardial Tbx3 (*Has2*) show little or no Tbx3 peak association. This may be indicative of these genes not being directly T-box modulated in the myocardium.
