

Supplementary Material

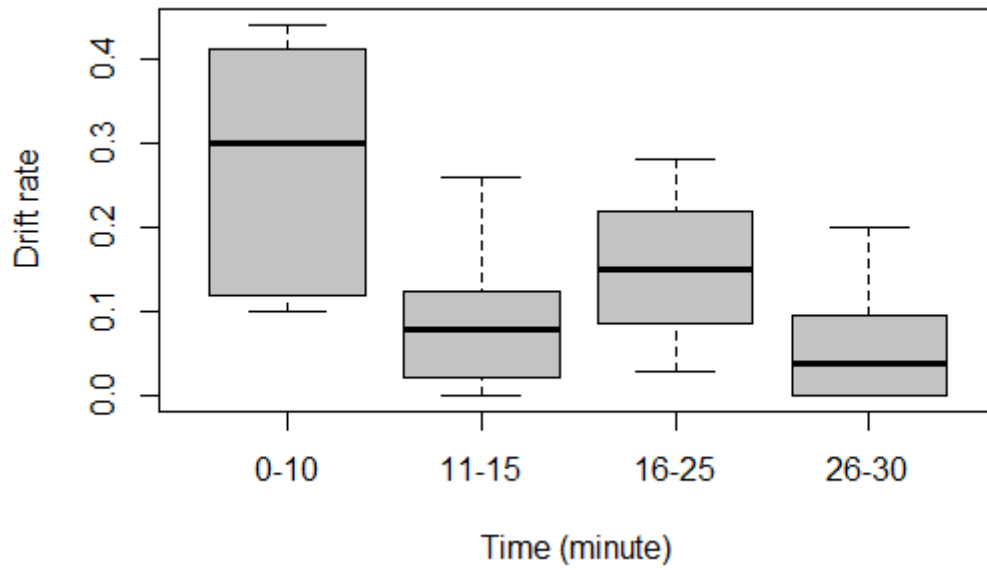

Fig. S1 Drift rates in base flow trials (50 fish stocked in each), with a constant discharge of 15 L s^{-1} for 30 minutes. Drift rates were calculated for the time periods corresponding to each of the experimental phases: acclimation (minutes 0-10), up-ramping (11-15), peak flow (16-25) and down-ramping (26-30). Bold lines and whiskers refer to median values and interquartile ranges, respectively.
