

Supplementary Figure 1: Visualization of the Oral Health Impact Profile-14 (OHIP-14) comparing patients with craniofacial disorder (CD) (n = 42) and controls (C) (n = 77) without CD considering the median OHIP-14 scores and subscores (functional [blue] and psychological [orange] well-being). OHIP-14 scores of the different groups were compared by the Mann-Whitney test. Statistical significance was considered at $p < .05$ and denoted with (A and B). Data outliers are given by stars
