

Suppl. Figure 1 Intracellular IFN γ staining after 4 hours PMA/Ionomycin stimulation

Histograms showing intracellular IFN γ staining (solid line) and isotype control staining (dotted line) of PBMCs from B-CLL patients after treatment with fludarabine (1 μ g/ml) for 24 hours and incubation for 4 hours in presence of PMA (1 ng/ml) and Ionomycin (0.5 μ g/ml) at a concentration of 2.5×10^6 cells/ml. One representative experiment out of two is shown.
