

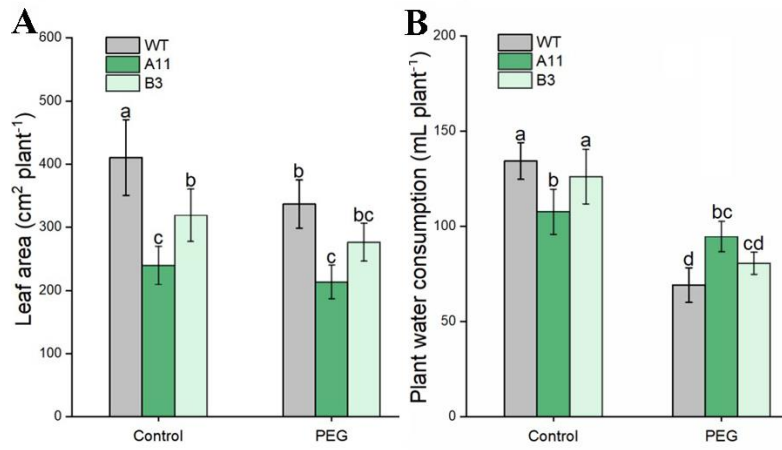

Figure S1. Plant leaf area and water consumption under 10% PEG (6000) and non-PEG conditions. Plant leaf area (A) and water consumption (B) within 24 h of PEG stress (PEG) and without PEG stress (control). Values are mean $\pm$ SD ($n = 4$), different letters on the top of each column indicate significance among genotypes and treatments by Duncan test at $P \leq 0.05$ level.
