Consistent with tests for sampling effects, the standardized niche-breadth metric B_std (B*) showed no association with the number of occurrence records, taken as a proxy for sampling effort, remaining non-significant in both Pearson and Spearman tests (Pearson r = -0.19, p = 0.504; Spearman ρ = 0.35, p = 0.206). Using log10(n_records) yielded similar results (Pearson r = -0.325, p = 0.237; Spearman ρ = -0.346, p = 0.206), indicating that B_std

Figure S2. Spatial patterns of predicted Anopheles species richness across South America under present and future climate scenarios.

Panels show stacked richness maps derived from binary suitability projections for all modelled species under current conditions and four future scenarios: (A) Current, (B) SSP2-4.5 2021–2040, (C) SSP2-4.5 2081–2100, (D) SSP5-8.5 2021–2040, and (E) SSP5-8.5 2081–2100. Darker shades indicate higher predicted richness.
