

Participants' overall gaze behavior during the EPELI subtasks

Online Resource 2 Heat maps of raw gaze data from the EPELI task for healthy controls ($n = 12$) and neglect patients ($n = 9$) across four scenarios. Warmer colors indicate a higher number of raw gaze data points (clusters), ranging from 1 to 64. The visualization included the central 10° horizontally, which was excluded from the statistical analyses of gaze behavior (see Table 2)
