

Figure S3: Ten modularity webs generated using ComputeModules with random seeds, showing the extent to which some taxa move among modules. Across the modularity webs, one cluster consistently has at least *P. blephariglottis*, *P. ciliaris*, and *P. x bicolor*. Nine of ten runs also included *P. x canbyi* in this module. The second consistent module included at least *P. grandiflora*, *P. psychodes*, *P. shriveri*, *P. peramoena*, and *P. flava*. Other modules were inconsistent and were rarely the same among runs.
