

Supplementary Figure S3. Clinical value of single PD-L1 mRNA level in the training set

In the Cox-regression model, continuous PD-L1 mRNA level was not predictive of the recurrence-free survival in the training set. Additionally, categorical value of PD-L1 mRNA level (top two-thirds vs. bottom one-third) was not significant for a prognostic differentiation by the log-rank test.

	HR	95% CI	P-value
Continuous PD-L1 mRNA	0.514	0.213-1.241	0.139
