Fig. S4. (a) Graphical representation of the co-expression of the differentially expressed genes between treatment resistant and untreated tumors (DESeq2 $\text{padj} < 0.05$ >1.5-fold difference). The graph was constructed from the normalized transcript counts of each gene and shows that Postn is the most connected gene. Edges correspond to Pearson correlation coefficients >0.9. (b) Coronal section showing periostin immunostaining in a large tumor mass of RCAS/H3G34R cells that occupies the left side of the brain (inset). The section was counterstained with hematoxylin. Scale bar = 50 microns.
