

ANALYSIS OF THE SAMPLE

To see how well our sample matches up with the index of PhilPapers, and whether the filtering that was conducted to guarantee the connectedness of the manifold was changing the dataset in substantial ways, I have produced below the temporal distributions of the three samples (the PhilPapers-Sample is restricted to an estimate based on 186 Journals, due to Web-Scraping-Restrictions).

TEMPORAL DISTRIBUTION OF THE WOS-SAMPLE AND THE PHILPAPERS-DATA

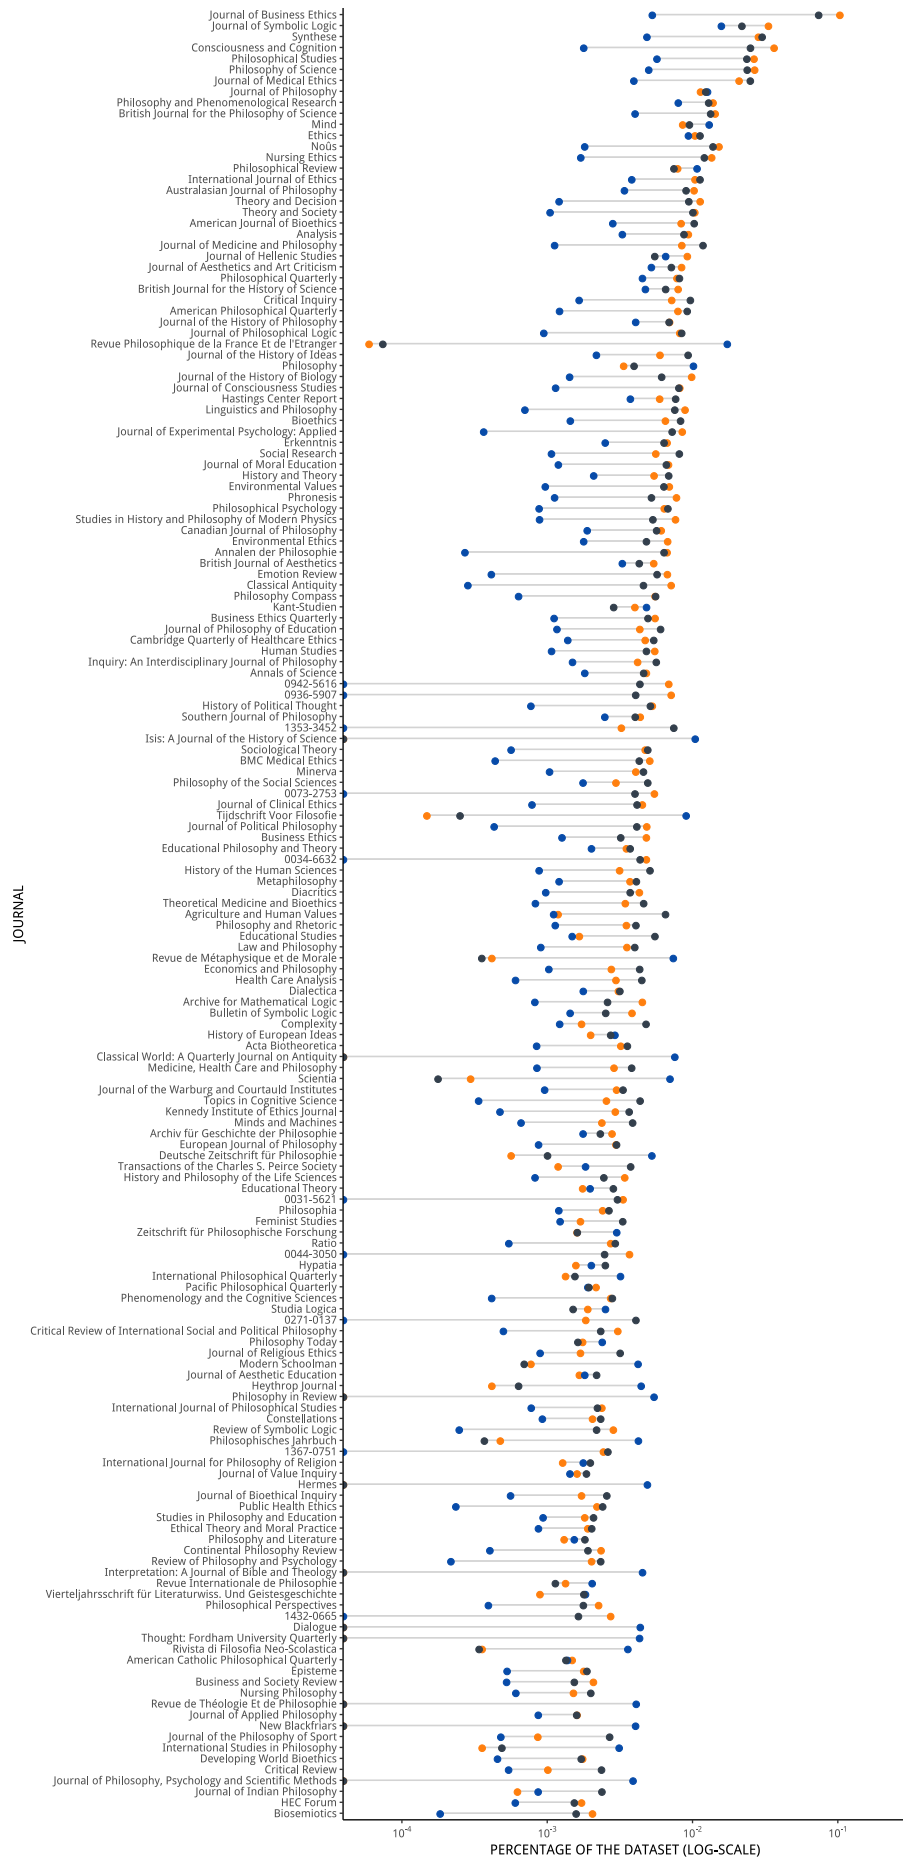

TEMPORAL DISTRIBUTION OF THE WOS-SAMPLE AND THE EXCLUDED DATA

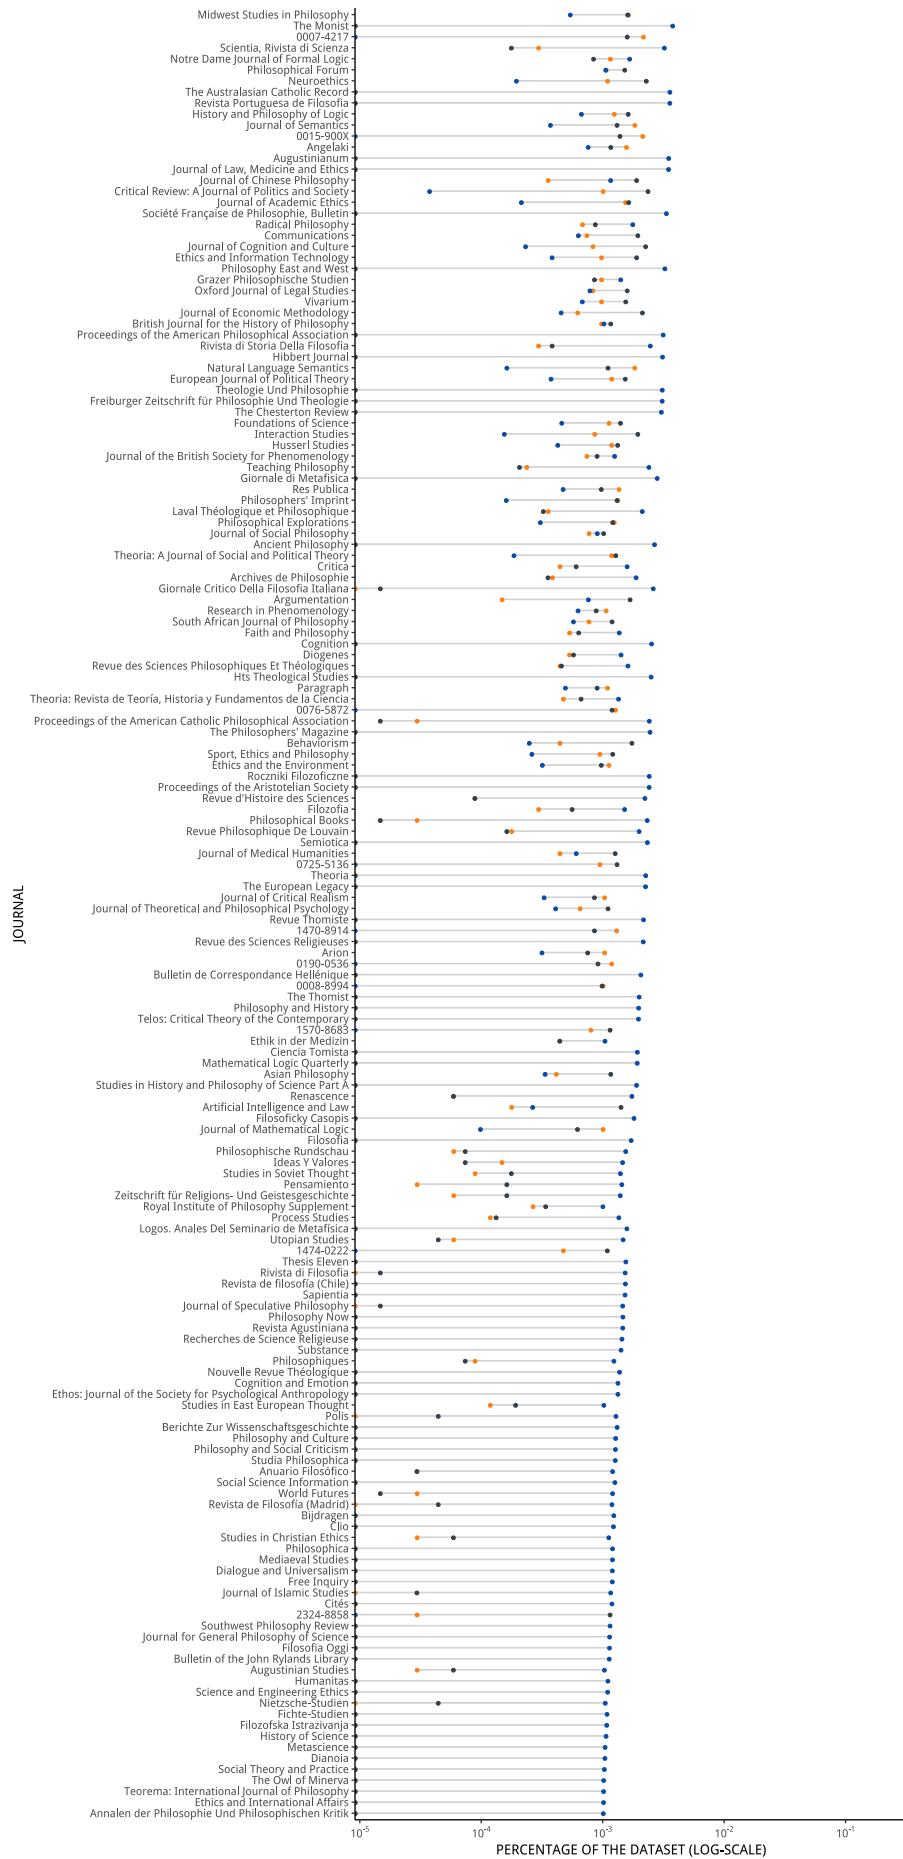

I have also included the distribution over the journals that make up more than one promille of either dataset. This makes it easy to spot outliers, like the oversampling of the *Journal of Business Ethics*, and the undersampling of the *Revue Philosophique de la France et de l'Étranger*. It should be noted that we can not expect a perfect fit between those datasets even under ideal circumstances, as our sampling strategy that only considers papers that received more than three citations does lean towards journals with higher impact.

COMPARISONS OF JOURNALS' SHARE IN PHILPAPERS, SAMPLED DATA AND EXCLUDED DATA

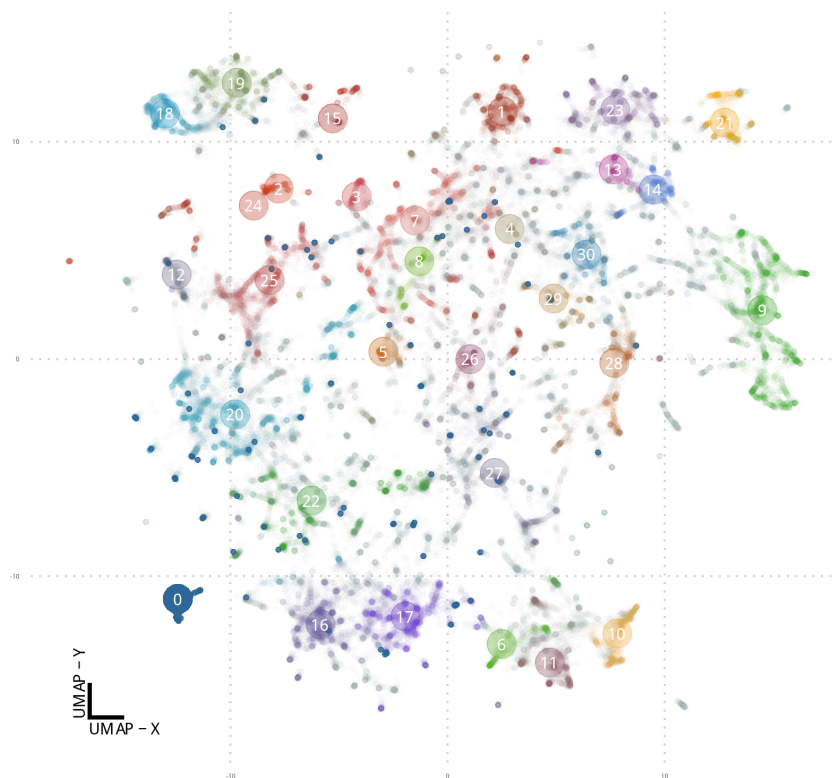

COMPARISONS OF JOURNALS' SHARE IN PHILPAPERS, SAMPLED DATA AND EXCLUDED DATA

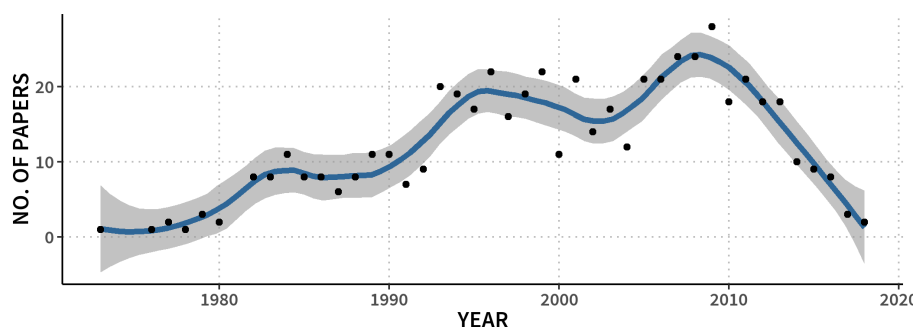

REPORT ON THE CLUSTERING

For each of the clusters I have included the nouns and noun phrases from the titles, abstracts and WOS-keywords. The following stopwords were removed: [*article*, *paper*, *essay*, *i*, *elsevier*, *inc*, *verlag*, *gmbh*, *springer*] They are either names of publishers or stem from the common usage of the phrase “In this paper I...”. The words are sorted by their Tfidf-Scores. I have also included the journals in which the most articles of every cluster were published, and the most frequently cited publications. The slight fading of the words indicates the (scaled) relative frequency of the items to the first item in the series. The illustrations indicate the position of the clusters in the UMAP-representation. For each cluster I also produce the distribution of its members over the time of its sample. Note that nearly all clusters exhibit a strong decrease in numbers towards the end of the sampled time. This does not tell us anything about trends, but is an artifact of the sampling-strategy: As we sampled by citation-counts, papers that had little time to accumulate citations will be under-represented. The temporal distributions should also be taken into account when interpreting the textual data (noun-phrases and nouns), as the WOS-database does only archive abstracts after 1990. This means that textual data gets very sparse before that, and therefore should be cautiously interpreted in clusters where the bulk of the data lies before 1990.
