Online Resource 5. Comparison between participants of the PACT and PACES trials, that completed 8-year follow-up and participants that were lost to follow-up.

Mean values at baseline, immediately post-intervention and after 6 to 9 months follow-up for A) general and physical fatigue as assessed by the MFI, B) anxiety and depression as assessed by the HADS and C) global

quality of life and summary score from the EORTC questionnaire. Compared are the intervention (green) and control (orange) groups that completed 8-year follow-up (square) and the groups that were lost to follow-up (star). The between-group differences were tested for significance with an unpaired T-test.

* = significant between-group difference (i.e. $p < 0.05$)

Abbreviations: EORTC = European Organisation for Research and Treatment of Cancer; HADS = Hospital Anxiety and Depression Scale; MFI = Multidimensional Fatigue Inventory; QoL = quality of life
