

Supplementary Figure 1 Predicted, 3-year - preclinical pattern of cognitive performance for individuals with normal cognition at baseline progressing to multidomain, amnesic mild cognitive impairment (aMCI-MD, left solid lines) vs. baseline pattern of cognitive impairment of individuals with normal cognition and rapid onset of Alzheimer's disease (AD, right solid lines). A qualitative trend is observed between the two groups: the predicted pattern of cognitive impairment at the onset of aMCI-MD is comparable to the baseline pattern of cognitive impairment of those that rapidly converting to AD. The gradient lines were designed to better delineate this qualitative trend
