

Supplementary Figure 2 RNAi cell microarrays made with spots printed with a mixture of two dsRNAs. Cells growing on the spots printed with only the DIAP1 dsRNA undergo cell death. The addition of dsRNAs targeting dPTEN or DRONC to the DIAP1 dsRNA prior to printing partially or totally rescues the cell death effect of DIAP1 depletion, respectively. Spots printed with DRONC or dPTEN dsRNAs alone are indistinguishable from the control GFP dsRNA. Scale bar = 800 μm .
