

Supplementary Figure 5: Detailed analysis of cFos within the insular cortex
cFos+ cells were counted in both Ctx+ and Ctx- animals along 6 A/P axis positions ranging from +2.1mm to -1.06mm relative to bregma. This analysis revealed that although cFos+ counts were significantly increased overall in the Ctx+ group compared to the Ctx- groups, there was no specific subregion along the A/P axis that revealed a significant difference.
