†Spatially biased by sample location

Supplemental Figure 6: Genotype proportions, spatial localization, and subcluster markers for additional subcortical, hippocampal and inhibitory cell types.

A-F: Genotype proportion (left, significant genotype bias indicated with asterisk), spatial localization in 4 samples (one from each genotype, middle), and differentially expressed genes by subgroup (right, dotplot colored by mean scaled expression), for additional neuronal cell types. Daggered clusters indicate those biased toward a specific genotype due to slice location on anterior-posterior axis.
