

Supplemental Figure 2. Characterization of iMGLs. A. iMGLs and iPSC-derived neurons (iNeurons) were immunostained with antibodies specific to microglia (IBA1), neurons (NeuN) and nuclei (NucBlue). B. Expression of microglia and neuronal gene markers were evaluated in transcriptomic data from the iMGLs and iPSC-derived neurons (iNeurons) to determine cell-type specificity. Scale represents base mean values.
