

Supplementary Fig 9

Supplementary Fig. 9: Bcl2 over-expression provides partial protection from CP-dn-ATF5 treatment. **A,B.** T98G cells were transfected with either GFP or GFP-BCL2 for 1 d and then exposed to 100 μ M CP-dn-ATF5 for 3 additional d. The cells were then stained with Hoescht 33328 to visualize nuclei and immunostained for GFP expression and assessed for (A) relative numbers of surviving GFP+ cells (in each case normalized to its respective control) or (B) % of GFP+ cells with apoptotic nuclei. Data are from 3 independent experiments, each carried out in triplicate.
