This figure displays 12 individual Western blot images, each enclosed in a red rectangular bounding box. The blots show various protein bands of different intensities and positions. Some blots have multiple lanes, while others are single-lane. The bands are dark against a light background, indicating protein presence. The images are arranged in a grid-like fashion: two rows of two blots each at the top, followed by two single-blot rows in the middle, and three rows of two blots each at the bottom.
