

Supplementary information, Figure S6

Figure S6 Characterization of G1 phase of Preleptotene Spermatocytes (G1) in synchronous spermatogenesis. **a** H&E staining and TEM images depict representative cross sections of testes from mice treated with WIN 18,446 followed by an RA injection and allowed to recover for 144 h. **b** Immunohistochemical staining for γ H2AX, STRA8, EdU and PH3 in sections from mice treated with WIN 18,446/144 h RA. Scale bar, 50 μ m. **c** Representative fluorescence images (observed by fluorescence microscope) and bright field images (observed by inverted phase contrast microscope) of total testicular cell population (upper panel) and sorted cell population by FACS (lower panel). Scale bar, 50 μ m. The purity of G1 phase of Preleptotene Spermatocytes (G1) is 96.9%.
