Supplementary information, Fig. S6

Supplementary information, Fig. S6 Knockdown using siRNA against ACE2 or candidate receptors. **a-d** H1299 cells were transfected with siRNA against (a) ACE2, (b) AXL, (c) EGFR or (d) LDLR for 24 h, and the knockdown efficiency was evaluated using RT-qPCR. The data shown are representative results from three independent experiments ($n = 3$). The data are shown as the mean $\pm$ SEM from three independent experiments. P values were calculated using two-way ANOVA (* $p < 0.05$).
