

Supplementary Figure 5

Supplementary Figure 5 EGFR-TKD interacts with Rheb.

(a) Schematic depiction of the intracellular domain of EGFR. (b) The EGFR-TKD binds Rheb. HEK-293T cells stably expressing SFB (S protein tag, FLAG tag, and Streptavidin binding peptide)-Rheb were transfected with the indicated V5-tagged plasmids and subjected to immunoprecipitation and analyzed by western blotting. (c) Purified GST-Rheb was bound to GDP and GTP in HPLC analysis.
