

Title : Supplementary Movie 1: WM4196 tilt-series, tomogram and the derived map and model.

Description: A movie to show a tilt-series which contributed to the final reconstruction, the corresponding tomographic reconstruction and the in situ core-signalling unit density, the derived MDFF equilibrated model and the fit of the model in the density. The threshold for the surface representation of the model is lowered during the rotation to accentuate the presence of the periplasmic ligand-binding domains.
