

Supplementary Figure 1

Supplementary Figure 1

a) Flowcytometry results of CORIN positive (left Y axis, pre-and post-sorting) cells and TRA-1-60 positive (right Y axis) cells in 25 lots of DAPs on culture day 12. b) Representative dot plot images exemplifying the gating strategy of flowcytometry, corresponding to Supplementary Figure 1a. The positive gate was set so that less than 0.1% of cells were positive in negative control sample. c) Flowcytometry results of cell viability and FOXA2 and TUJ1 (efficacy markers) positive cells in 25 lots of DAPs on culture day 26. d) Representative dot plot images exemplifying the gating strategy of flowcytometry, corresponding to Supplementary Figure 1c. The positive gate was set so that less than 0.1% of cells were positive in negative control sample. e) Flowcytometry results of OCT3/4, TRA-2-49/6E, SOX1, PAX6, and KI67 (safety marker) positive cells 25 lots in DAPs on culture day 26. f) Representative dot plot images exemplifying the gating strategy of flowcytometry, corresponding to Supplementary Figure 1e. The positive gate was set so that less than 0.1% of cells were positive in negative control sample. g, h) Gene expressions of *POU5F1* (g) and *LIN28* (h) by RT-qPCR analysis in 25 lots of DAPs on culture day 26. The expression level of undifferentiated iPSCs was set to 1. i) In vitro detection of residual undifferentiated iPSCs in iPSC maintenance condition. Several spiking iPSCs were mixed with dissociated DAPs and cultivated for 14 days. Colonies of undifferentiated iPSCs were stained by alkaline phosphatase. Cells in 100% iPSC condition formed too many colonies, resulting in spontaneous differentiation. Bars=1 cm (n=3 independent experiments).

Supplementary Figure 2

Supplementary Figure 2

(a-f) Results of the methylation array analysis of 73 cancer-related genes in 5 samples used in the tumorigenicity study (a-e) and human fetal tissue (f) as a control. GBM, glioblastoma multiforme; VM, ventral mesencephalon; CTX, cortex; SC, spinal cord; GE, ganglionic eminence; DM, dorsal mesencephalon; HB, hindbrain.

Supplementary Figure 3

Supplementary Figure 3

a) Images of H-E staining of epithelium-like cell clusters found in the brain of NOG mice. Right is a magnification of upper left, and lower left is a magnification of right. Bars: left upper=1 mm, left lower=100 μ m, and right=500 μ m. b) Immunohistochemistry of the cell clusters. TTR, transthyretin; TH, tyrosine hydroxylase. Bars=100 μ m. a-b) n=6 independent experiments. c) H-E staining of mouse brains injected with undifferentiated 201B7 (number of cell preparations=2 and number of animals=6) and MCB003 (number of cell preparations=2 and number of animals=7). Bars=1 mm. d) H-E staining of testis of NOG mice injected with undifferentiated MCB003 (number of cell preparations=1 and number of animals=6). Bar in leftmost panel=1 mm, others=100 μ m.

Supplementary Figure 4

Supplementary Figure 4

a) The modified culture protocol (+LDN). b) RT-qPCR results of the expression of TTR in intermediates (day 12) and the final product (DAPs) in the original and modified culture protocols. Values are the mean $\pm$ SD (n=3 independent experiments). c) Gene expression patterns of dopaminergic neuron-related genes by RT-qPCR. Values are the mean $\pm$ SD (n=3 independent experiments). d) H-E staining and immunohistochemistry of cells injected into the brain of a nude rat with the original (number of animals=7) or modified culture protocol (number of animals=6). Left images are magnified in the other images. Bars=100 μ m. Number of cell

preparations=3.

Supplementary Table 1. Modifications between laboratory-grade and GMP-grade cell production

	Laboratory Use (ref. 8)	Pre-clinical / Clinical trial
Sorting Buffer	PBS (-) or HBSS (-)	PBS (-)
	2% FBS	2% FBS, gamma-ray irradiated
	50 µg/mL Penicillin/Streptomycin	80 µg/mL Gentamycin
Cell Dissociation Enzyme	1×Accumax	0.5×TrypLE Select (with 0.5 mM EDTA/PBS (-))
Dead Cell Exclusion	7-AAD	None
Anti-CORIN Antibody	Gift from KAN Research Institute	Phycoerythrin-conjugated antibody (Sumitomo Dainippon Pharma)
Negative control	Stained with 2nd antibody	Unstained sample or stained with PE-isotype control
Differentiation media	KSR	Gamma-ray irradiated KSR
	Neurobasal/B27 w/o vitamin A	Neurobasal/B27 w/o vitamin A (gamma-ray irradiated B27)
	2 mM L-glutamate	2 mM Glutamax
	50 µg/mL Penicillin/Streptomycin	80 µg/mL Gentamycin
Replating plate	Lipidure-coated 96-well plate (U-shaped)	PrimeSurface 96U plate (Sumitomo Bakelite)

Supplementary Table 2. Characterization of the human iPSC master cell bank (MCB003)

Test Item	Test Method	Criteria	Results
Morphology	Microscopy observation	Human iPSC-like morphology	Complied
Cell count	Cell count	For information only	3.1×10^6 cells/tube
Viability	Cell count	For information only	93%
Growth Rate-Doubling	Cell count	For information only	14.6 hours
Undifferentiated markers	Flowcytometry	TRA-1-60 ≥ 90 %	97.6 %
		TRA-2-49 ≥ 90 %	100 %
		SSEA4 ≥ 90 %	100 %
Sterility	JP17 ^a (direct method)	Complies	Complied
Mycoplasma	JP17 (nucleic acid amplification test)	Negative	Negative
Endotoxin	JP17 (LAL ^b turbidimetry test)	< 24 EU/mL	< 0.05 EU/mL
Karyotype	G-band	Normal	Normal
Viral testing	ICH Q5A	Negative	Complied

^aThe Japanese Pharmacopoeia Seventeenth Edition

^bLimulus amoebocyte lysate

Supplementary Table 3. In-process testing for the manufacturing of DAPs

Process		Test Items	Test Method	Criteria
Prepared reagents (In-process test 1–6)		Sterility	Membrane filter	Negative
Expand iPSCs (In-process test 1–3)		Cell number	Cell counter	Required cell number
		Morphology	Microscopy	Colony formation
		Sterility	BacT/ALERT (Culture supernatant)	Negative
	In-process test 5	Cell number	Cell counter	Required cell number
Differentiation	In-process test 4–6	Morphology	Microscopy	Attached to the plate (test 3–5) Sphere formation (test 6)
		Sterility	BacT/ALERT	Negative
	In-process test 4, 6	Mycoplasma	qPCR	Negative
	In-process test 6	Endotoxin	LAL ^a turbidimetry test	≤ 1 EU/mL
	(In-process test 5, pre-sort)	Residual undifferentiated iPSCs	Flowcytometry: TRA-1-60	< 1%
	(In-process test 5, post-sort)	Purity of sorted cells	Flowcytometry: CORIN	> 90%

^a Limulus Amebocyte Lysate

Supplementary Table 8. Summary of pre-clinical *in vivo* studies of human iPSC-derived dopaminergic progenitors

Study Aim	Host, Administration route	Duration	Number of animals	Number of cell preparation	Cells/ animal	Evaluation	Findings
Tumorigenicity	NOG mouse, unlesioned, Striatum	Life-long (52 weeks)	N=80; DAPs	6	2×10^5	Mortality/Morbidity,	No effect on mortality/morbidity, animal observations or pathology.
Biodistribution						General health,	No graft overgrowth.
Toxicology			n=50; Control (Saline)			Neurobehavioral tests, Hematology/Blood chemistry, Urinalysis, Necropsy, Histopathology	Asymptomatic ectopic structures (choroid plexus epithelium-like cells) observed within graft. Little proliferative capacity (scattered Ki67+ cells, negative in ectopic structures).
Detection of residual iPSCs	NOG mouse, unlesioned, Subcutaneous with Matrigel	26 weeks	n=20; DAPs	7	6×10^5	Teratoma formation	No teratoma formation in every DAP group. Teratoma formation was observed in the positive control group (other iPS cell line and HeLa cells).
			n=10; 100% iPSCs			Tumor size	
			n=50; spiked with 10%~0.001% iPSCs			Histology	
			n=10; iPSC (201B7)				
			n=10; HeLa cells				
			n=10; Control (Matrigel)				
Efficacy	Nude rat, 6- OHDA lesioned, Striatum	20 weeks	n=8; DAPs n=6; Control (Saline)	2	4×10^5	Behavioral test Histology	Methamphetamine-induced rotational behavior improved 16 weeks after transplantation. Human-derived dopaminergic neurons survived.
	Cynomolgus monkey, MPTP- lesioned, Putamen	8-24 weeks	n=3; DAPs	2	$1.5\text{--}2.0 \times 10^6$	Radiology (MRI) Histology	Grafts were detected in MRI images. Human-derived dopaminergic neurons survived. No ectopic structures of dopaminergic neurons survived in the graft.

Supplementary Table 9. 2 × 2 matrix for quality control of cellular products

	SAFETY		EFFICACY	
CELLULAR COMPONENTS	Unwanted cells	Undifferentiated iPSCs Early neural stem cells Transformed cells	Active cells	DA progenitor cells
NON-CELLULAR COMPONENTS	Process-derived impurities	Animal-derived materials Anti-CORIN antibody	Active ingredients	Dopamine
	Adventitious microbial agents	Bacteria Mycoplasma Endotoxin Virus		

Supplementary Table 10. PMDA requirements and solutions in this study

Issues		PMDA requirement	Solutions
Quality of cell product	Reagents	Meet Japanese standards of biological raw materials	Complied with requirement
	Residual iPSCs in final product	Assess the result of tumorigenicity study	Set criteria as OCT3/4/TRA-2-49/6E: <0.1% in flowcytometry and confirm no tumor formation
	Residual immature neural cells	Sox1/PAX6 positive cells should be evaluated	Set criteria as SOX1/PAX6: <0.1% in flowcytometry and confirm no tumor formation
	Residual vectors	To be confirmed in iPSCs	Confirm no residual plasmids in iPSCs and final product
	Genome/epigenome abnormality	No further request	WGS, SNP array / Methylation array
	Non-cell impurities	<120 µg/day (ICH M7)	Complied with requirement
Tumorigenicity/ Toxicity/ Biodistribution	Host species	NOG mice	NOG mouse / MPTP monkey
	Animal number per group	At least 10 animals for histological evaluation	Started 40 animals per group
	Observational period	Life-long (as long as possible)	Life-long (52 weeks after transplantation)
	Injection site	Same as clinical cases	Brain (striatum)
	Teratoma formation	Subcutaneous space of NOG mice, with Matrigel	Subcutaneous injection with Matrigel Testis injection
Efficacy study		No further request	6-OHDA nude rat / MPTP monkey

Supplementary Table 11. Assessment of viruses in the iPSC-derived master cell bank

Test Items	Test Method	Results
Infectivity	Co-culture with HEK293	Retrovirus was not detected
Electron Microscopic Observation	Electron microscopic observation	No extraneous agents observed in the 200 cell profiles examined
Reverse Transcriptase Activity	PCR (Polymerase chain reaction)	Pass
<i>In vitro</i> Assays	3 detector cell lines: MRC-5, Vero, and HeLa cells	Pass
<i>In vivo</i> Assays	Suckling mouse, adult mouse, guinea pigs and embryonated eggs	Pass
Cell Specific Virus Tests	PCR Target viruses: HSV 1/2 (Herpes Simplex Virus Type 1 & 2) B19 (Parvovirus B19) EBV (Epstein-Barr Virus) SV40 (Simian Virus 40) hCMV / HHV5 (Human Cytomegalovirus / Human Herpesvirus Type 5) HHV6 (Human Herpesvirus Type 6) HHV7 (Human Herpesvirus Type 7) HHV8 (Human Herpesvirus Type 8) HTLV (Human T Cell Leukemia Virus) HCV (Hepatitis C Virus) HAV (Hepatitis A Virus) HBV (Hepatitis B Virus) HIV-I (Human Immunodeficiency Virus Type 1) HIV-II (Human Immunodeficiency Virus Type 2) HBoV (Human Bocavirus) hMPV (Human metapneumovirus) lineage A and B WNV (West Nile Virus) VZV (VariCella Zoster Virus) HuPyV (Human Polyoma Virus) WUPyV (WU polyomavirus) KIPyV (KI polyomavirus) HPyV (Human polyomavirus) pathogen detection (MCPyV, HPyV6, HPyV7, TSPyV, HPyV9)	Negative

Supplementary Table 15. Test items evaluated in the general toxicity and tumorigenicity studies.

Test Items	Tendency
Clinical signs	Twice a day on the day of transplantation (before administration, about 4 hours after administration); once a day on other days
Body weight	Once a week
Food consumption	Once a week
General physical condition and behavior: modified Irwin's method	Before transplantation, 3, and 12 months after transplantation
Ophthalmological examination	Before transplantation, 3, and 12 months after transplantation
Urinalysis: color, pH, protein, glucose, ketone bodies, bilirubin, occult blood, urobilinogen	Before transplantation, 3, and 12 months after transplantation
Hematology: red blood cell count, white blood cell count, hematocrit value, hemoglobin concentration, platelet count, mean corpuscular volume, mean corpuscular hemoglobin, mean corpuscular hemoglobin concentration, reticulocyte count, white blood cell types (eosinophil count, basophil count, neutrophil count, monocyte count, and lymphocyte count). When necessary, Wright-stained blood smears were also evaluated.	Upon necropsy or emergency euthanasia (when possible)
Blood chemistry: aspartate transaminase, alanine transaminase, alkaline phosphatase, creatine kinase, total bilirubin, total protein, albumin, globulin, total cholesterol, triglyceride, glucose, urea nitrogen, creatinine, inorganic phosphate, calcium, sodium, potassium, chloride, protein fraction (albumin ratio, α 1-globulin ratio, α 2-globulin ratio, β -globulin ratio, γ -globulin ratio, and A/G ratio)	Upon necropsy or emergency euthanasia (when possible)
Necropsy	On the next day after the observation period, death or emergency euthanasia
Organ weight:	Upon necropsy Target organs/tissues: lungs (including the bronchial tubes), submandibular/sublingual glands, liver (including the gallbladder), heart, kidneys, testes, epididymides, prostate gland, seminal vesicles, ovaries, uterus, brain, spleen, thymus, pituitary gland, thyroid/parathyroid glands, adrenal glands.
Histopathology tests: H-E and immunohistochemistry staining (human cell-specific antibody, KU80; proliferation-specific antibody, KI67; dopaminergic neuron-specific antibody, TH; epithelial cell-specific antibody, pan-cytokeratin; choroid plexus-specific antibody, TTR)	Target organs/tissues: trachea, lungs (including the bronchial tubes), tongue, submandibular/sublingual glands, esophagus, stomach (forestomach, Glandular stomach), small intestine (duodenum, jejunum, ileum), large intestine (cecum, colon, rectum), pancreas, liver, gallbladder, aorta, heart, kidneys, bladders, testes, epididymides, prostate gland, seminal vesicles, ovaries, uterus, vagina, brain (site of administration, cerebrum, cerebellum, pons, medulla oblongata), spinal cord, sciatic nerves, sternum/sternal bone marrow, femur/femoral bone marrow, submandibular lymph nodes, mesenteric lymph nodes, spleen, thymus, pituitary gland, thyroid/parathyroid glands, adrenal glands, eye balls/optic nerves, lacrimal glands, Harderian glands, skeletal muscles (quadriceps muscles), mammary glands, skin (ventral), skin (dorsal), sites of gross abnormalities.
