

Title: Supplementary Data 1

Description: Entity-level Spearman rank correlation between interest and mobility. For modes, all entities are shown. For foods, top 10 entities most and least correlated across countries on average are shown (* marks $p < 0.05$ between seasonality adjusted interest and mobility according to two-sided test with no correlation null hypothesis, - marks too low search interest in a country. All entities related to consuming food at home are correlated positively on average, all entities related to consuming food outside of home are correlated negatively on average, except barbecue.
