

Reporting Summary

Nature Portfolio wishes to improve the reproducibility of the work that we publish. This form provides structure for consistency and transparency in reporting. For further information on Nature Portfolio policies, see our [Editorial Policies](#) and the [Editorial Policy Checklist](#).

Statistics

For all statistical analyses, confirm that the following items are present in the figure legend, table legend, main text, or Methods section.

n/a	Confirmed
☒	☒ The exact sample size (<i>n</i>) for each experimental group/condition, given as a discrete number and unit of measurement
☒	☐ A statement on whether measurements were taken from distinct samples or whether the same sample was measured repeatedly
☒	☐ The statistical test(s) used AND whether they are one- or two-sided <i>Only common tests should be described solely by name; describe more complex techniques in the Methods section.</i>
☒	☐ A description of all covariates tested
☒	☐ A description of any assumptions or corrections, such as tests of normality and adjustment for multiple comparisons
☒	☐ A full description of the statistical parameters including central tendency (e.g. means) or other basic estimates (e.g. regression coefficient) AND variation (e.g. standard deviation) or associated estimates of uncertainty (e.g. confidence intervals)
☒	☐ For null hypothesis testing, the test statistic (e.g. <i>F</i> , <i>t</i> , <i>r</i>) with confidence intervals, effect sizes, degrees of freedom and <i>P</i> value noted <i>Give P values as exact values whenever suitable.</i>
☒	☐ For Bayesian analysis, information on the choice of priors and Markov chain Monte Carlo settings
☒	☐ For hierarchical and complex designs, identification of the appropriate level for tests and full reporting of outcomes
☒	☐ Estimates of effect sizes (e.g. Cohen's <i>d</i> , Pearson's <i>r</i>), indicating how they were calculated

Our web collection on [statistics for biologists](#) contains articles on many of the points above.

Software and code

Policy information about [availability of computer code](#)

Data collection	CST Studio Suite 2023, MATLAB R2022b
Data analysis	CST Studio Suite 2023, MATLAB R2022b

For manuscripts utilizing custom algorithms or software that are central to the research but not yet described in published literature, software must be made available to editors and reviewers. We strongly encourage code deposition in a community repository (e.g. GitHub). See the Nature Portfolio [guidelines for submitting code & software](#) for further information.

Data

Policy information about [availability of data](#)

All manuscripts must include a [data availability statement](#). This statement should provide the following information, where applicable:

- Accession codes, unique identifiers, or web links for publicly available datasets
- A description of any restrictions on data availability
- For clinical datasets or third party data, please ensure that the statement adheres to our [policy](#)

The data generated in this study are provided in the article, Supplementary Information and Source Data file. Source data file is provided with this article.

Research involving human participants, their data, or biological material

Policy information about studies with [human participants or human data](#). See also policy information about [sex, gender \(identity/presentation\), and sexual orientation](#) and [race, ethnicity and racism](#).

Reporting on sex and gender

The study aimed to evaluate the enhancement effects of metamaterials on magnetic resonance imaging (MRI) in healthy volunteers. Findings from this study apply to all participants regardless of their sex or gender. Participants were recruited without specific consideration of sex or gender differences, and these variables were not factored into the study design. Sex and gender were determined based on self-reporting during participant recruitment, but this information was not used in the analysis. In this study, sex and gender information was recorded, but it was not relevant to the research objectives. Therefore, no disaggregated sex and gender data are available for this study.

Reporting on race, ethnicity, or other socially relevant groupings

As the primary objective was to assess the imaging improvements provided by the metamaterial, the research did not specifically focus on race, ethnicity, or other socially relevant groupings. Therefore, no categorization variables related to race or ethnicity were collected or used in the analysis.

Population characteristics

The study population consisted of university students aged 18-28 years. There were no specific requirements or restrictions regarding genotypic information, past or current diagnoses, or treatment categories.

Recruitment

Participants were primarily recruited through social media platforms within the Tsinghua University. The recruitment strategy aimed to engage volunteers from various academic departments and years of study.

Ethics oversight

The experimental validation involving human subjects was approved by the Tsinghua University Science and Technology Ethics Committee (Medicine) (Project No: THU01-20230202), and informed consent was obtained from the volunteer.

Note that full information on the approval of the study protocol must also be provided in the manuscript.

Field-specific reporting

Please select the one below that is the best fit for your research. If you are not sure, read the appropriate sections before making your selection.

☒ Life sciences ☐ Behavioural & social sciences ☐ Ecological, evolutionary & environmental sciences

For a reference copy of the document with all sections, see [nature.com/documents/nr-reporting-summary-flat.pdf](https://www.nature.com/documents/nr-reporting-summary-flat.pdf)

Life sciences study design

All studies must disclose on these points even when the disclosure is negative.

Sample size

The study involved a single participant, as the research aimed to demonstrate a proof of concept for the metamaterials and associated MRI equipment, rather than conduct a full clinical trial.

Data exclusions

No data were excluded from the analysis.

Replication

To ensure the reproducibility of the findings, two separate MRI scans were conducted on the same volunteer, spaced two weeks apart. Both attempts were successful, confirming the consistency of the results.

Randomization

The participant, a 24-year-old male, was randomly recruited from a pool of graduate students within the university.

Blinding

Blinding was not applicable in this study, as the investigation focused on a proof of concept for the metamaterials and equipment, rather than a clinical trial with multiple groups. Given that MRI is a standard medical imaging technique, no group allocation or blinding was necessary.

Reporting for specific materials, systems and methods

We require information from authors about some types of materials, experimental systems and methods used in many studies. Here, indicate whether each material, system or method listed is relevant to your study. If you are not sure if a list item applies to your research, read the appropriate section before selecting a response.

Materials & experimental systems

n/a	Involved in the study
☒	☐ Antibodies
☒	☐ Eukaryotic cell lines
☒	☐ Palaeontology and archaeology
☒	☐ Animals and other organisms
☒	☐ Clinical data
☒	☐ Dual use research of concern
☒	☐ Plants

Methods

n/a	Involved in the study
☒	☐ ChIP-seq
☒	☐ Flow cytometry
☒	☐ MRI-based neuroimaging

Plants

Seed stocks

Report on the source of all seed stocks or other plant material used. If applicable, state the seed stock centre and catalogue number. If plant specimens were collected from the field, describe the collection location, date and sampling procedures.

Novel plant genotypes

Describe the methods by which all novel plant genotypes were produced. This includes those generated by transgenic approaches, gene editing, chemical/radiation-based mutagenesis and hybridization. For transgenic lines, describe the transformation method, the number of independent lines analyzed and the generation upon which experiments were performed. For gene-edited lines, describe the editor used, the endogenous sequence targeted for editing, the targeting guide RNA sequence (if applicable) and how the editor was applied.

Authentication

Describe any authentication procedures for each seed stock used or novel genotype generated. Describe any experiments used to assess the effect of a mutation and, where applicable, how potential secondary effects (e.g. second site T-DNA insertions, mosaicism, off-target gene editing) were examined.
