

Description of Additional Supplementary Files

File name: Supplementary Data 1

Description: Western blot analysis of membrane preparations of CHO cells transiently transfected with either t β 1AR or L72 t β 1AR. (a) Expression was confirmed for both variants relative to transfection with empty vector, loading quantity was controlled using a BCA assay. (b) TRPC3 was also used as a loading control. (c) The crude membrane preparations (obtained following ultracentrifugation) was solubilised in both DDM and SDS, to confirm that expression yields observed are due folded protein (with only folded protein able to be solubilised by DDM).
