¹ Hazard ratios (99% confidence intervals) estimated from Cox models (stratifying on matched set) comparing people with eczema to those without eczema. Results are implicitly adjusted through matching on age, sex and general practice, and calendar time, as comparators entered the cohort on the same day as exposed individuals. * indicates that the result is significant under Bonferroni-correction.

² Estimated as the rate in the exposed * (1/crude hazard ratio)

³ Rate in the exposed - observed rate in the unexposed

⁴ Rate in the exposed - rate in the exposed * (1/crude hazard ratio)

⁵ Rate in the exposed - rate in the exposed * (1/comorbidity-adjusted hazard ratio)

Hazard ratios from "Cohort studies on 71 outcomes among people with atopic eczema in UK primary care data" ranked by main adjusted hazard ratio from the any-age cohort, compared to corresponding outcomes defined either as category-level ICD-10 code or phecode and their ranking by main adjusted hazard ratio from the any-age cohort. No corresponding outcomes were available for eosinophilic oesophagitis and cigarette smoking.
