Raw data corresponding to «free SUMO» panels from Figure 4d

Lysates from pSG5, pSG5-SUMO1-HisHA and pSG5-SUMO2-HisHA transfected cells were all resolved on the same 15-well polyacrylamide gel. Proteins were then transferred on one PVDF membrane. This membrane was then cut in two halves and incubated either with anti-SUMO1 (left half) or anti-SUMO2 (right half) antibodies.
