Supplementary results | Exclusion of maternal contamination

Boxplots of B-allele frequency (BAF) of rare SNPs called in mother, but absent from umbilical cord, as an indicator of possible maternal contamination across placental samples. 5000 SNPs were used for each patient. The central thick line represents the median, the box represent the interquartile range, the whiskers denote the extreme values or 1.5 times the interquartile range from the nearest edge of the box (whichever is smaller) when outliers are present. The maternal blood sample is placed in each plot (furthest right) as a control.
