The molecular weight markers used for western blots is **PageRuler™ Plus Prestained Protein Ladder, 10 to 250 kDa (Thermo Scientific™, 26619)**, unless stated otherwise. The 65 and 25kDa markers do not fluoresce as well as the other molecular weight markers when imaged on the LICOR CLx Odyssey and have therefore not been depicted in any of the original scans. The brightness/contrast of certain original scans has been increased to highlight the molecular weight markers. In certain blots [**Figure 4a (45 minutes fractionation) – PB1, BTN3A3 & Extended Data Figure 9a – PB1**] the signal from the red channel is stronger than the signal from the molecular weight markers. Consequently the molecular weight markers are not visible on these blots.
