Supplementary Figure 1: Raw gel image of a 2% agarose gel showing various PCR products from *B. hansenii* culture, with and without DNase treatment. TriDye™ 1 kb Plus DNA Ladder molecular weight marker is marked on both sides. Dashed box indicates image cropping for the final figure (see **Fig. 4e**). PCR primer information is available in **STable 4** and expected band sizes are noted in **Fig. 4e** with the exception of the phage internal primers which have an expected size of 200bp. This experiment was repeated three times with similar results.
