Note: Actin is probed from the membrane on which the CXCL non-reducing condition was aquired. For the reducing and non-reducing condition comparison, lysates were prepared such that a single aliquot of protein was prepared, and an equal volume of protein solution from this aliquot was loaded into the relevant gels, which were subsequently run side-by-side.

Extended Data Fig. 4n

Note: Actin is probed from the membrane on which pAKT was run. pAKT and AKT were probed on different blots because stripping and reprobing failed. For this experiment, lysates were prepared such that a single aliquot of protein was prepared, and an equal volume of protein solution from this aliquot was loaded into the relevant gels, which were subsequently run side-by-side.
