

The bony labyrinth of toothed whales reflects both phylogeny and habitat preferences.

Loïc Costeur, Camille Grohé, Gabriel Aguirre-Fernandez, Eric Ekdale, Georg Schulz, Bert Müller, Bastien Mennecart

Supplementary Data 2: Bony labyrinths of all studied species in 7 views, arranged by clades following the composite phylogeny of Figure 1. “Left” and “right mirrored” on top refer to the side of the bony labyrinth.

The bony labyrinth of toothed whales reflects both phylogeny and habitat preferences.

Loïc Costeur, Camille Grohé, Gabriel Aguirre-Fernandez, Eric Ekdale, Georg Schulz, Bert Müller, Bastien Mennecart

Supplementary Data 4: PCAs on the dataset with original data and slid landmarks by Bending Energy and Procrustes Distances. CVAs on the dataset with original data and slid landmarks by Bending Energy and Procrustes Distances. The first two figures illustrate PCA and CVA for the whole bony labyrinth, the two next figures illustrate PCA and CVA for the semi-circular canals only and the last two figures illustrate PCA and CVA for the cochlea only.

The bony labyrinth of toothed whales reflects both phylogeny and habitat preferences.

Loïc Costeur, Camille Grohé, Gabriel Aguirre-Fernandez, Eric Ekdale, Georg Schulz, Bert Müller, Bastien Mennecart

Supplementary Information 5: Specimens information and scanning parameters.

Supplementary Information 6: Methods and statistics used in this study.

Methods

Geometric morphometrics analyses

Bony labyrinths were first segmented using Avizo Standard Edition 7.0 ®, 8.0 ® (Visualization Sciences Group, an FEI Company, 2013), and AVIZO Lite ® (2016). Segmentation of structures that open outside the periotic (cochlear aqueduct and endolymphatic sac) were carried out up to the aperture and stopped when they opened.

Left bony labyrinths were preferably selected when available. When not, right ones were selected and reflected using an application of Landmark Editor 3.6 software (Wiley, 2006).

Aguirre-Fernandez et al. (2017) detail the 3D geometric morphometrics analyses applied here. We used Landmark Editor to digitize the specimens with a large number of landmarks (i.e., 717). This brings strong congruence with the actual shape of the bony labyrinth. After collecting the landmarks, two other approaches were tested where we slid the semi-landmarks along the curves during the superimposition process of the Generalized Procrustes Analysis minimizing Bending Energy (BE) and the Procrustes Distances (PD) (see Tseng et al. (2015) and Grohé et al. (2016)). Both methods were carried out with the Geomorph package implemented in R, version 3.1.1. Finally, shape variation in bony labyrinth morphology (disparity and similarity using PCA and CVA) was investigated using the geometric morphometrics and statistical methods of MorphoJ 1.06d (Klingenberg, 2011).

All methods were applied to several datasets consisting of either the entire bony labyrinth or subsets as defined by the semi-circular canals only (i.e., 256; Landmarks 1 to 256) and the cochlea only (i.e., 451 landmarks; Landmarks 257 to 707). The landmarks 708 to 717 represent the vestibular aqueduct. The three datasets were then analysed without sliding (Raw Data) or using both criteria (BE and PD); nine datasets were then created. We run the multivariate analyses on the three datasets for comparative purposes.

Principal Component Analysis (PCA) is used to visualise the overall shape variation among specimens. Distances in this space are real measures of differences among specimens. In the space defined by PC axes, groups may appear as clusters if there is similarity of shape within them. It is noteworthy that the axes describe variation within the overall sample and not morphological differences between the groups.

The phylogenetic signal was tested by first mapping the tree to the shape data (polymorphospace), via squared-change parsimony, and calculating the length of the tree. A permutation procedure was then used to shuffle the shape data among the tips of the tree. Finally, the permuted tree lengths were compared to the original tree (randomised rounds: 10000) (Klingenberg and Gidaszewski, 2010).

The phylogenetic hypothesis (presented on Figure 1) is based on the combined data of Barnes (2006), Hassanin et al. (2012), and Geisler et al. (2014). In contrast to Lambert & Post (2005), we suggest that the specimens attributed to cf. *Protophocaena* from Belgium are not pontoporiids, but basal delphinids based on the shape of the bony labyrinth. The phylogenetic tree was created using Mesquite 3.04 (Maddison and Maddison 2010).

The impact of allometry on the shape has been tested using a MorphoJ routine. A regression using the PC scores and the centroid size was performed. A permutation test (number of rounds 10,000) gave the p-values.

Canonical Variate Analysis (CVA) was applied to all three above-mentioned datasets (RawData, BE, PD). It is an ordination method that maximises between group variation, relative to within group variation, according to the specified grouping variable (randomised rounds: 10000). Distances in this space are distorted, and do not represent the actual

difference between specimens or groups, but are instead scaled relative to within group variation. This analysis allows us to investigate shape differences that may be related to habitat preference (freshwater, coastal, fully marine, and marine polar animals) by performing permutation tests of pairwise distances (using Mahalanobis and Procrustes distances) between the grouping variable (here the type of habitat). It is important to note that CVA has some important assumptions regarding the number of specimens and groups relative to the number of variables in the analysis (see Mitteroecker and Bookstein, 2011, particularly Figures 3-5). The group that has few taxa (in our dataset: “ marine polar”) is problematic, because the method uses within-group versus between group differences to calculate the axes. And thus in small groups, the difference between them and the others will be incorrectly estimated. These morphological modifications are highlighted in the results obtained from the different datasets. Nevertheless, more thorough conclusions can be provided on the relationship between shape and ecology based on the three other habitats.

Procrustes sums of squares: 0.34826545124891567

Tangent sums of squares: 0.34382815329249755

Data matrices in this dataset:

- BE_All, raw data
- BE_All, centroid size
- BE_All, Procrustes coordinates

New Procrustes fit:

Dataset 'BE_All'

717 landmarks in 3 dimensions.

The dataset contains 32 observations, of which 32 are included for analyses.

Average shape:

Procrustes sums of squares: 0.34826545124891567

Tangent sums of squares: 0.34382815329249755

Data matrices in this dataset:

- BE_All, raw data
- BE_All, centroid size
- BE_All, Procrustes coordinates

Principal Component Analysis: PCA: CovMatrix, BE_All, Procrustes coordinates

31.	0.00002221	0.200	100.000

Total variance: 0.01109123

Variance of the eigenvalues: 0.0000000062628

Eigenvalue variance scaled by total variance: 0.00005

Eigenvalue variance scaled by total variance and number of variables: 0.10920

Note: throughout all calculations of eigenvalue variances, the dimensionality used was 2144.

Please double-check because this dimensionality may not be appropriate for all situations.

Warning: There appear to be fewer PCs than dimensions in shape space. This can have the following reasons, among others:

- the degrees of freedom are less than the shape dimensionality (sample size, etc.).
- there is complete integration in the data.

Interpret the results cautiously and check for reasons why this is the case.

Phylogenetic mapping

Dataset: PC scores, CovMatrix, BE_All, Procrustes coordinates

Data type: PC scores

Phylogeny: Phylogeny

Method: weighted squared-change parsimony

The tree is rooted.

Tree length: 0.10571257

Permutation test against the null hypothesis of no phylogenetic signal

Number of randomization rounds: 10000

P-value: <.0001

Canonical Variate Analysis: CVA ...BE_All

Dataset: BE_All

Classification criterion: environment

Groups Observations

- | | | |
|----|-------------|----|
| 1. | coastal | 15 |
| 2. | continental | 8 |
| 3. | marine | 7 |
| 4. | polar | 2 |

Variation among groups, scaled by the inverse of the within-group variation

	Eigenvalues	% Variance	Cumulative %
1.	2.86408711	51.315	51.315
2.	1.57043558	28.137	79.452

3. 1.14689561 20.548 100.000

Mahalanobis distances among groups:

	coastal	continental	marine
continental	3.2857		
marine	3.1473	4.1787	
polar	5.1982	4.6536	6.1549

P-values from permutation tests (10000 permutation rounds) for Mahalanobis distances among groups:

	coastal	continental	marine
continental	0.0001		
marine	0.0010	0.0003	
polar	<.0001	0.0842	0.0251

Procrustes distances among groups:

	coastal	continental	marine
continental	0.0634		
marine	0.0642	0.0960	
polar	0.1145	0.0963	0.1307

P-values from permutation tests (10000 permutation rounds) for Procrustes distances among groups:

	coastal	continental	marine
continental	0.0199		

marine	0.0439	0.0003	
polar	0.0161	0.0645	0.0096

New Procrustes fit:

Dataset 'BE_Canals'

256 landmarks in 3 dimensions.

The dataset contains 32 observations, of which 32 are included for analyses.

Average shape:

Procrustes sums of squares: 0.32630358941122606

Tangent sums of squares: 0.3223423480086

Data matrices in this dataset:

- BE_Canals, raw data
- BE_Canals, centroid size
- BE_Canals, Procrustes coordinates

New Procrustes fit:

Dataset 'BE_Canals'

256 landmarks in 3 dimensions.

The dataset contains 32 observations, of which 32 are included for analyses.

Average shape:

Procrustes sums of squares: 0.32630358941122606

Tangent sums of squares: 0.3223423480086

Data matrices in this dataset:

- BE_Canals, raw data
- BE_Canals, centroid size
- BE_Canals, Procrustes coordinates

Principal Component Analysis: PCA: CovMatrix, BE_Canals, Procrustes coordinates

31.	0.00001550	0.149	100.000

Total variance: 0.01039814

Variance of the eigenvalues: 0.0000000135653

Eigenvalue variance scaled by total variance: 0.00013

Eigenvalue variance scaled by total variance and number of variables: 0.09560

Note: throughout all calculations of eigenvalue variances, the dimensionality used was 761.

Please double-check because this dimensionality may not be appropriate for all situations.

Warning: There appear to be fewer PCs than dimensions in shape space. This can have the following reasons, among others:

- the degrees of freedom are less than the shape dimensionality (sample size, etc.).
- there is complete integration in the data.

Interpret the results cautiously and check for reasons why this is the case.

Phylogenetic mapping

Dataset: PC scores, CovMatrix, BE_Canals, Procrustes coordinates

Data type: PC scores

Phylogeny: Phylogeny_BE_Canals

Method: weighted squared-change parsimony

The tree is rooted.

Tree length: 0.11770675

Permutation test against the null hypothesis of no phylogenetic signal

Number of randomization rounds: 10000

P-value: 0.1624

Canonical Variate Analysis: CVA ...BE_Canals

Dataset: BE_Canals

Classification criterion: environment

Groups Observations

1. coastal 15
2. continental 8
3. marine 7
4. polar 2

Variation among groups, scaled by the inverse of the within-group variation

	Eigenvalues	% Variance	Cumulative %
1.	3.40290548	56.916	56.916
2.	1.52561791	25.517	82.434
3.	1.05025811	17.566	100.000

Mahalanobis distances among groups:

	coastal	continental	marine
continental	3.8492		
marine	2.6440	4.2482	
polar	5.1355	6.6419	4.9089

P-values from permutation tests (10000 permutation rounds) for Mahalanobis distances among groups:

	coastal	continental	marine
continental	<.0001		
marine	0.0285	0.0004	
polar	0.0032	<.0001	0.0555

Procrustes distances among groups:

	coastal	continental	marine
continental	0.0550		
marine	0.0532	0.0750	
polar	0.0988	0.1204	0.0991

P-values from permutation tests (10000 permutation rounds) for Procrustes distances among groups:

	coastal	continental	marine
continental	0.0637		
marine	0.1618	0.0002	
polar	0.1364	0.0413	0.1772

New Procrustes fit:

Dataset 'BE_Cochlea'

451 landmarks in 3 dimensions.

The dataset contains 32 observations, of which 32 are included for analyses.

Average shape:

Procrustes sums of squares: 0.4268211667521373

Tangent sums of squares: 0.4201339065293579

Data matrices in this dataset:

- BE_Cochlea, raw data
- BE_Cochlea, centroid size
- BE_Cochlea, Procrustes coordinates

New Procrustes fit:

Dataset 'BE_Cochlea'

451 landmarks in 3 dimensions.

The dataset contains 32 observations, of which 32 are included for analyses.

Average shape:

Procrustes sums of squares: 0.4268211667521373

Tangent sums of squares: 0.4201339065293579

Data matrices in this dataset:

- BE_Cochlea, raw data
- BE_Cochlea, centroid size
- BE_Cochlea, Procrustes coordinates

Principal Component Analysis: PCA: CovMatrix, BE_Cochlea, Procrustes coordinates

Total variance: 0.01355271

Variance of the eigenvalues: 0.0000000132516

Eigenvalue variance scaled by total variance: 0.00007

Eigenvalue variance scaled by total variance and number of variables: 0.09718

Note: throughout all calculations of eigenvalue variances, the dimensionality used was 1346.

Please double-check because this dimensionality may not be appropriate for all situations.

Warning: There appear to be fewer PCs than dimensions in shape space. This can have the following reasons, among others:

-- the degrees of freedom are less than the shape dimensionality (sample size, etc.).

-- there is complete integration in the data.

Interpret the results cautiously and check for reasons why this is the case.

Phylogenetic mapping

Dataset: PC scores, CovMatrix, BE_Cochlea, Procrustes coordinates

Data type: PC scores

Phylogeny: Phylogeny_BE_Cochlea

Method: weighted squared-change parsimony

The tree is rooted.

Tree length: 0.14002329

Permutation test against the null hypothesis of no phylogenetic signal

Number of randomization rounds: 10000

P-value: 0.0001

Canonical Variate Analysis: CVA ...BE_Cochlea

Dataset: BE_Cochlea

Classification criterion: environment

Groups Observations

1. coastal 15
2. continental 8
3. marine 7
4. polar 2

Variation among groups, scaled by the inverse of the within-group variation

	Eigenvalues	% Variance	Cumulative %
1.	2.07340885	44.618	44.618
2.	1.85336713	39.883	84.500

3. 0.72028933 15.500 100.000

Mahalanobis distances among groups:

	coastal	continental	marine
continental	3.2256		
marine	3.3397	3.9255	
polar	3.5246	3.8803	4.3720

P-values from permutation tests (10000 permutation rounds) for Mahalanobis distances among groups:

	coastal	continental	marine
continental	<.0001		
marine	0.0001	0.0012	
polar	0.9696	0.8620	0.2792

Procrustes distances among groups:

	coastal	continental	marine
continental	0.0653		
marine	0.0811	0.1039	
polar	0.0870	0.0882	0.1086

P-values from permutation tests (10000 permutation rounds) for Procrustes distances among groups:

	coastal	continental	marine
continental	0.0381		

marine	0.0082	0.0021	
polar	0.3773	0.2449	0.1700

New Procrustes fit:

Dataset 'PD_All'

717 landmarks in 3 dimensions.

The dataset contains 32 observations, of which 32 are included for analyses.

Average shape:

Procrustes sums of squares: 0.2441427185486877

Tangent sums of squares: 0.24195941431844775

Data matrices in this dataset:

- PD_All, raw data
- PD_All, centroid size
- PD_All, Procrustes coordinates

New Procrustes fit:

Dataset 'PD_All'

717 landmarks in 3 dimensions.

The dataset contains 32 observations, of which 32 are included for analyses.

Average shape:

Lmk.	Axis 1 (x)	Axis 2 (y)	Axis 3 (z)

Procrustes sums of squares: 0.2441427185486877

Tangent sums of squares: 0.24195941431844775

Data matrices in this dataset:

- PD_All, raw data
- PD_All, centroid size
- PD_All, Procrustes coordinates

Principal Component Analysis: PCA: CovMatrix, PD_All, Procrustes coordinates

31.	0.00001996	0.256	100.000

Total variance: 0.00780514

Variance of the eigenvalues: 0.0000000029870

Eigenvalue variance scaled by total variance: 0.00005

Eigenvalue variance scaled by total variance and number of variables: 0.10517

Note: throughout all calculations of eigenvalue variances, the dimensionality used was 2144.

Please double-check because this dimensionality may not be appropriate for all situations.

Warning: There appear to be fewer PCs than dimensions in shape space. This can have the following reasons, among others:

-- the degrees of freedom are less than the shape dimensionality (sample size, etc.).

-- there is complete integration in the data.

Interpret the results cautiously and check for reasons why this is the case.
