Supplementary Figure 1

General scheme of the molecular interference assay using SHAPE chemistry, performed in the present work.

Supplementary Figure 2

Representative double filter retention assay to monitor the 40S recruitment by the non-related RNA-100. Figure shows an autoradiography of nitrocellulose (upper) and nylon (lower) membranes from a titration experiment using a fixed concentration of 0.1 nM of the internally radiolabelled RNA-100 and increasing amounts of the 40S subunit. Quantitative analysis was performed as described in Methods section. The results are shown as % of complex in the bottom row.
