Supplementary Figure S1. The Box plots of extracted PLR parameters (base radius, minimal radius, relative constriction, latency, constriction time, and response time) in all participants at different age groups. The data were separated into the high-risk (HR) and low-risk (LR) groups, and males (M) and females (F) in each group. The box boundaries indicate the 25th and 75th percentile; the line within the box represents the median; and error bars indicate the 90th and 10th percentiles.
