

Supplementary Figure S7. Results of correlation analysis of BM and DD methods followed by susceptibility testing of clinical isolates. Vancomycin (A-B), gentamycin (C-D) and amikacin (E-F). Left panel: Scattergrams comparing the results of broth microdilution MICs (mg/L) and zone diameters (mm) for 49 *Streptomyces* strains. The lines represent the proposed ZD interpretative criteria. **Right panel:** The graph depicts zone diameters distribution for 84 clinical *Streptomyces* strains, dotted lines represents proposed zone diameter breakpoint (S - susceptible category) and CO_{WT} value.
