

Supplementary Figure S4. Macrophage subset characterization and relative change of CD14⁺ monocyte subsets from patients with LILRB1 variant. CD14⁺ monocytes on the 2-index (macrophage polarization index; MPI, and activation-induced macrophage differentiation index; AMDI) MacSpectrum plot were designated as “M2-like”, “M1-like”, “transitional M1-like”, and “preactivation” cell types. Point size indicates relative change of cell number of specific CD14⁺ monocyte subset in patients compared to healthy control. Green and red colors represent positive and negative change, respectively.
