

Supplementary Figure 1: Diagram in boxplot graphs presenting the pulmonary function variables of the sample stratified between survivors and non-survivors. Panel A: forced vital capacity (FVC); Panel B: forced expiratory volume in the first second (FEV1); Panel C: FEV1/FVC ratio; Panel D: forced expiratory volume in the first second as percent of predicted. *: $p < 0.05$ when comparing survivors *versus* non-survivors.
