

Appendix D. Supplemental Figures

Figure D1. Correlation Matrix for All Outcome Metrics

Note. Pearson correlations were calculated for each of the respective questionnaires across the entire ($n = 347$) sample—with the exception of the Ozel-Kizil HF scale which one participant did not complete (thus $n = 346$ for correlations with this metric), and creative achievement scores which are the log-transformed total scores excluding those with a total score of 0 ($n = 269$ for correlations with this metric). Gray boxes indicate the correlations which were not statistically significant at $p < 0.05$. AHQ-D, Dispositional Adult Hyperfocus Questionnaire; CAARS, Conners' Adult ADHD Rating Scale (total raw score); HF, hyperfocus.
