

Supplementary information

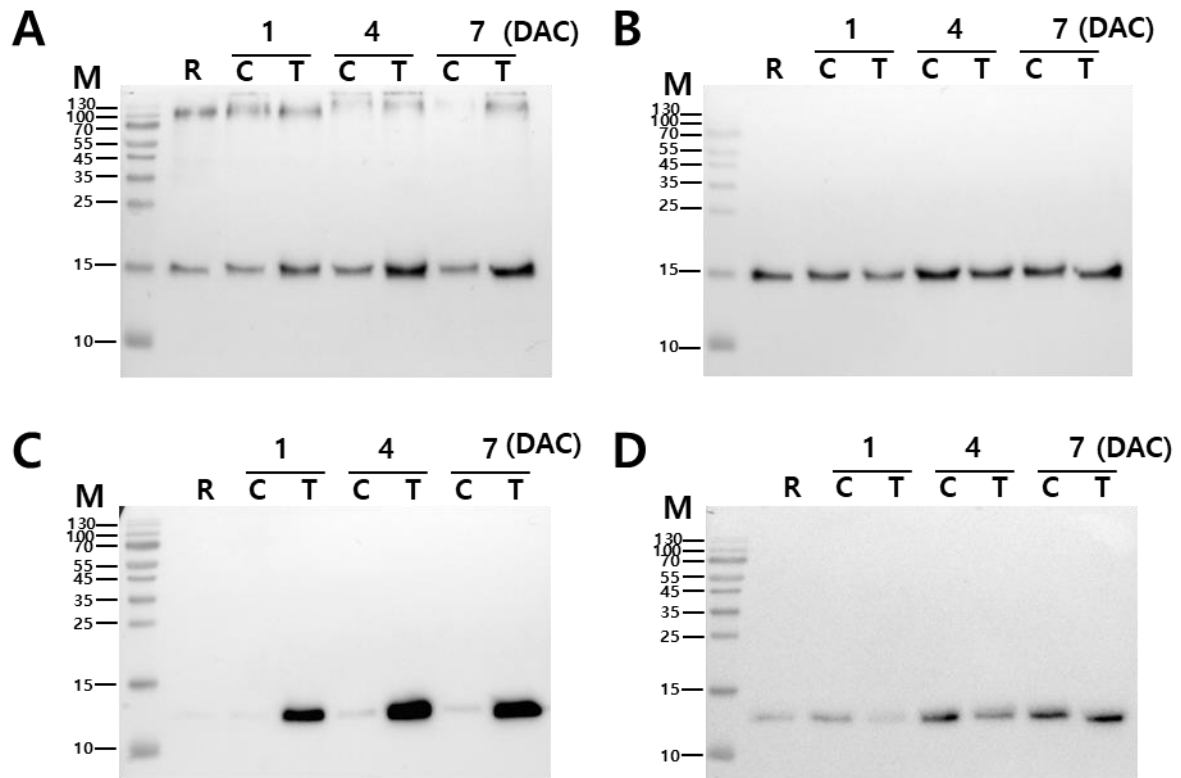

Figure S1. Full-size immunoblot image of Figure 1C. A-D shows immunoblot images of antibodies: (A) anti-acetylated histone H3, (B) anti-histone H3, (C) anti-acetylated histone H4, and (D) anti-histone H4, respectively. Only the band regions detected in the immunoblot were cropped and used in Figure 1C. Proteins were extracted from 7-day-old seedling root explants with callus incubated in CIM with or without TSA after 1, 4, and 7 days. R: Root, C: control callus, T: TSA-treated callus, DAC: days after CIM incubation, M: size marker (*kDa*).
