

Supplemental Figure S1. Haplotype Network of the IIS6 segment of the  $Na_v$  gene in *Aedes albopictus* from Brazil. The network was based on a genealogical analysis using the TCS method. Dashed lines between dots represent mutational events between connected haplotypes. \*Haplotypes 2s6\_02 and 2s6\_09 are represented as a single haplotype because they differ by only one nucleotide in an alignment region with a gap (sites with gaps in the alignment are not considered in the TCS haplotype network).
