

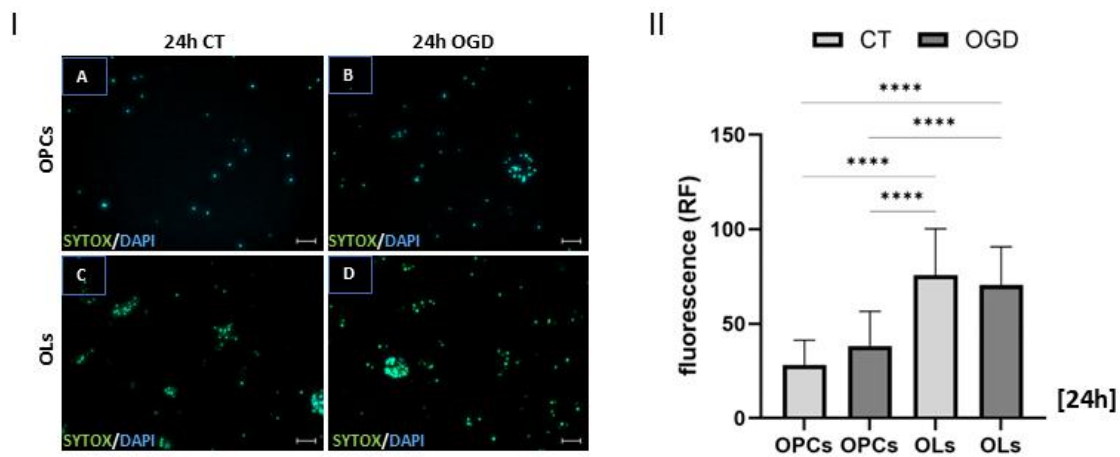

Fig. S4. Evaluation of cell viability by SYTOX (green) test on OPCs and OLs fractions 24h after OGD (I, A-D). Cell nuclei were visualized with DAPI (blue). Scale bar: 50 μ m. II Comparison of data calculated from microscopic images between experimental groups at the selected time-points. The differences are marked as statistically significant if: $*p < 0.05$, $**p < 0.01$; $***p < 0.001$, $****p < 0.0001$
