Supplementary Fig. 1 | SEM images of pristine Cu powder (**a**, **b**) and Cu powder after ethane activation for 1 hour at 0.2 O₂ mole fraction with 20 mg·mL⁻¹ Cu loading in 1.0 M HClO₄ (**c**, **d**).

Supplementary Fig. 2 | XRD patterns of pristine Cu powder and Cu powder after ethane activation for 1 hour at 0.2 O₂ mole fraction with 20 mg·mL⁻¹ Cu loading in 1.0 M HClO₄.

Supplementary Fig. 3 | XPS spectra of pristine Cu powder (**a**, **b**) and Cu powder after ethane activation for 1 hour at 0.2 O₂ mole fraction with 20 mg·mL⁻¹ Cu loading in 1.0 M HClO₄ (**c**, **d**).

Supplementary Fig. 4 | Raman spectra of pristine Cu powder and Cu powder in 1.0 M HClO_4 .

Supplementary Fig. 5 | NMR spectra of ethane, propane and methane activation for 1 hour at 0.2 O_2 mole fraction with $20 \text{ mg} \cdot \text{mL}^{-1}$ Cu powder in 1.0 M HClO_4 . The concentration of DMSO standard in all samples was $50 \mu\text{M}$.

Supplementary Fig. 6 | The production rate and distribution of ethane activation with different mole fractions of O₂ in gas feed. Error bars represent the standard deviation of four independent measurements, and the data are presented as mean values $\pm$ standard deviation.

Supplementary Fig. 7 | GC profiles (a) and NMR spectra (b) for control experiments of ethane activation with ethane, O_2 or Cu powder was absent in the reaction system. The ethane activation data was obtained at $20\text{ mg}\cdot\text{mL}^{-1}$ Cu powder in 1.0 M HClO_4 with ethane and O_2 mole ratio of 8:2. The trace amounts of products in experiments without O_2 are likely due to a slight ambient air filtration to the system during reaction. In experiments using Cu^{2+} ions instead of Cu powder, the concentration of Cu^{2+} of 0.18 M was chosen to match the final concentration of Cu^{2+} after ethane activation (Supplementary Table 10). See Methods for more experimental details.

Supplementary Fig. 8 | The production rate and distributions of minor products in propane activation at different O₂ mole fractions in 1.0 M HClO₄ with 20 mg·mL⁻¹ Cu powder. Error bars represent the standard deviation of four independent measurements, and the data are presented as mean values ± standard deviation.

Supplementary Fig. 9 | Comparisons of ethane activation performance using H_2O_2 or O_2 as the oxidant.

Supplementary Fig. 10 | Comparisons of ethane activation performance in 1.0 M HClO₄ at 0.2 O₂ mole fraction using 20 mg·mL⁻¹ Cu, Pt, and Pd powder as the catalyst.

Supplementary Fig. 11 | Mass spectrometry profiles of produced C_2H_4 using $^{12}\text{C}_2\text{H}_6$ (**a**) or $^{13}\text{C}_2\text{H}_6$ (**b**) as gas feed.

Supplementary Fig. 12 | NMR spectra of produced acetic acid using $^{12}\text{C}_2\text{H}_6$ or $^{13}\text{C}_2\text{H}_6$ as gas feed.

Supplementary Fig. 13 | Mass spectrometry profiles of produced acetic acid using $^{16}\text{O}_2$ or $^{18}\text{O}_2$ as gas feed.

Supplementary Fig. 14 | Comparisons of production rates between ethane activation conducted in 1.0 M HClO₄, 0.5 M H₂SO₄, 1.0 M NaClO₄, 1.0 M H₃PO₄ or 1.0 M H₂C₂O₄ at 0.2 O₂ mole fraction with 20 mg·mL⁻¹ Cu powder.

Supplementary Fig. 15 | The product rate and distribution of ethane activation with different stirring rates in 1.0 M HClO₄ at 0.2 O₂ mole fraction with 20 mg·mL⁻¹ Cu powder. Error bars represent the standard deviation of four independent measurements, and the data are presented as mean values ± standard deviation.

Supplementary Fig. 16 | **a**, Remaining Cu loading and **b**, ethylene production rates as a function of reaction time and oxygen mole fraction in gas feed. Error bars represent the standard deviation of four independent measurements, and the data are presented as mean values $\pm$ standard deviation.

Supplementary Fig. 17 | Comparisons of ethane activation performances using recycled Cu powder and pristine commercial Cu powder in three consecutive experiments in 1.0 M HClO₄ at 0.2 O₂ mole fraction.

Supplementary Fig. 18 | *In situ* Raman spectra on Cu powder in 1.0 M HClO₄ under pure ethane, propane, methane, O₂ or Ar atmosphere.

Supplementary Fig. 19 | Comparisons of *in situ* Raman spectra of ethane activation at 0.2 O₂ mole fraction using H₂O and D₂O.

Supplementary Fig. 20 | *In situ* Raman spectra on Cu powder with a, different alcohols and b, iodoalkanes in 1.0 M HClO₄. Additional bands at 440~550 cm⁻¹ are attributed to the stretching mode of C-I bond of undissociated iodoalkanes¹.

Supplementary Fig. 21 | *In situ* Raman spectra on Cu powder with **a**, deuterated iodoethane and **b**, deuterated iodomethane in 1.0 M HClO₄.

Supplementary Fig. 22 | Comparisons of production rates from ethylene oxidation and ethane activation at 0.2 O₂ mole fraction.

Supplementary Fig. 23 | The isotopologue distribution of ethanol oxidation products using ¹⁶O₂ or ¹⁸O₂ as gas feed.

Supplementary Fig. 24 | MD simulations for the formation of Cu oxides after Cu being exposed to O₂ where orange and red spheres stand for Cu and O atoms, respectively.

Supplementary Fig. 25 | Structures of the initial state (**a**), transition state (**b**), and final state (**c**) of the first C-H cleavage in ethane activation where orange, red, grey and white spheres stand for Cu, O, C and H atoms, respectively.

Supplementary Fig. 26 | Possible reaction pathways for ethane activation after first C-H cleavage under neutral conditions where the white square symbol stands for an oxygen vacancy and N.A. stands for no free energy barrier.

Supplementary Fig. 27 | Possible reaction pathways for ethane activation after first C-H cleavage under acidic conditions where the white square symbol stands for an oxygen vacancy and N.A. stands for no free energy barrier.

Supplementary Fig. 28 | Comparisons of ethane activation performance in 1.0 M HClO_4 using Cu, CuO, or Cu_2O as the catalyst.

Supplementary Fig. 29 | Reaction cell employed for light alkane activation.

Supplementary Fig. 30 | Carbon balances for the oxidation of 10 mM ethanol and acetic acid using 20% O₂ + 80% Ar. The amount of CH₄ and CO₂ was multiplied by 0.5 because their carbon number is half of that in ethanol or acetic acid.

Supplementary Table 1 | Apparent production rates of ethane activation under various O₂ mole fractions. The unit for all production rates is $\mu\text{mol}\cdot\text{h}^{-1}$. N.D. stands for Not Detected. Data are presented as mean values $\pm$ standard deviation from four independent measurements.

O ₂ mole fraction	C ₂ H ₄	CH ₃ COOH	C ₂ H ₅ OH	CH ₃ CHO	CH ₄	CO ₂	C ₂ H ₄ selectivity	CH ₃ COOH selectivity
