

Description of Additional Supplementary Files

File name: Supplementary Data 1

Description: Species trait information. Sample sizes are provided for each species in the body mass and head-body (HB) length datasets. Ecological traits include: hibernation (NONE = does not hibernate, DT = daily torpor, HIB = hibernator); hibernation binary (N = no, Y = yes); habitat buffer, three-state habitat buffering (O = obligate, F = facultative, N = does not buffer); activity time, binned mean body mass, and binned mean head-body (HB) length. Body mass, total length, tail length, and head-body (HB) length ranges extracted from the literature. R² values are based on regressions of log₁₀ head-body length and log₁₀ body mass for each species. References are provided for ecological and morphological traits for each species in the Supplementary Information.
