

Transcription and DNA replication collisions lead to large tandem duplications and expose targetable therapeutic vulnerabilities in cancer

In the format provided by the authors and unedited

Gating strategy for flow cytometry. Cells were first gated by their scatter (SSC-A (side scatter-area) vs FSC-A (forward scatter-area)). The singlets were then isolated by gating on SSC-W (side scatter-width) vs SSC-H (side scatter-height) cells. The BFP positive population was then isolated by collecting cells positive in the Pacific Blue channel. Cells were either collected in bulk or collected as single cells in a 96-well plate.
