

Additional file 2

In vitro replication ability of GLV-1h68 in different human cancer cells lines. Viral titers in infected cell cultures were determined in triplicates by plaque assays 24, 48 and 72 hours post infection and 2 replication patterns could be distinguished. 3 cell lines (red box) resisted replication during the first 24 hours whereas 10 cell lines (green box) allowed GLV-1h68 replication even early within the first hours.
